Lost in Space - The Toolbag Orbiting the Earth

Skywatchers have a new object to search for in the night sky, a small bag of tools what is orbiting the earth.

NASA astronauts were repairing the outside of the International Space Station

(ISS) in Friday when one of them accidentally let go of their toolbag, sending it floating into space.

Unbelievably, the small bag is actually bright enough to see from earth with a small telescope. If you interest to search for it, the bag currently orbits the Earth two to four minutes ahead of the ISS, but will remain in orbit only for a few months before to fall into the earth's atmosphere.

A space walk is one of the riskiest activity that astronauts can do, mainly because they are exposing to excessive radiation. There is also the nightmare scenario that an astronaut might become unattached to the object that they are repairing. If the astronaut on last Friday's mission would have tried to reach out and catch their toolbag, they could have ended up in orbit as well!
